They want to install bloated apps, eat memory, and to constantly nag you for more ink. Trim your printer setup to the minimum with this five-step guide. Image via Kevin Cortopassi. Mac owners and brave Linux adherents don't really need this guide. Oversized, heavily branded printer software does exist for Mac platforms, but you can use most any printer by simply plugging it in and hitting Command-P in an app. Linux, for the most part, works the same way, with the essential driver bits baked into the core of the system. That leaves Windows. A hardware driver is supposed to be a simple, mostly hidden interface, but the majority of printer installation packages eÁÁwhether installed off the CD in the box or from the printer maker's web site eÁÁwant to do far more than just explain a printer's inner workings to your system. When you're cleaning up a slow-going system, look in the system tray, or hit Ctrl+Shift+Esc. You'll likely find one or more apps running that do nothing more than wait for a printer or scanner to be connected, then somehow pop up and do, well, something. Some printer makers step a bit further, installing toolbars in your browser for supposed "smart printing," and installing a whole mess of software for image editing, photo retouching, project printing, and scanning that's far less useful than a lot of free software. In my case, my printer isn't always connected to my main laptop, and even if it were, I'm just scanning things occasionally. So, I don't need a "digital image monitor" that runs on my system at all times. Right-click the entry in the start folder and press Delete. He did not remove the program, only the shortcut, so you can always add it if it is useful. Now let's see what other treats our printer asked our system to start automatically every time. Open your start menu and enter MSCONFIG and press ENTER (in Windows XP, enter MSCONFIG in the "Execute" element in the Start menu. Click the Start tab. Find this list the manufacturer of your printer. It's never good to make bold disclosures about computer problems, but I can say that I've never found a situation where a computer needed some kind of automatic startup application and printer to print. When it is time to print, your application gets in touch with the driver, who feeds The printer, and its paper comes out of the roll. When you're done, press "Apply." If you really needed one of your applications, you can always go back to MSCONFIG and check the application again, so experiment with clear awareness. What applications do you really need? Please note the name of the application, usually finished with ".exe", and enter the search box in the sysinfo.org home list. You will likely find it there, along with a letter-coded recommendation about whether you need to keep it running or not: N, U and X are safe not to check in your msconfig window. I am also a little ashamed of admitting that I did not realize that Windows Fax and Scan were available in all versions of Windows 7, and the business, business and definitive editions of Windows Vista. It is a fairly simple tool to simply take a document of your scarce, keep it on your hard drive and continue your life. You can also handle faxes, if your system is configured with a telom connection. The Twitter user Hqraja suggested Freecapture also. But most of the respondents were given that their applications for the edition of favorite images, painting.net, picasa and more, offer their own functionality of the scarce, generally hidden in a function of "importation" in the File menad. Does it need to turn the text into the paper on your screen? We like Freeec for its serious simplicity (direct download link here). Readers also responded with suggestions only for Simplorescr.windows: their esciner probably came with OCR software. However, what is most likely that it will be unbridled ... Reading editing software of moresimple that can read in the general favorite selections of our readers for the editing of images, but tend to be a bit Deep of what the average user needs for a simple touch. UPS, light solutions and cut/change of size, except Picasa. Picasa is a great tool to edit, red eye reduction, cut and send emails or support photos, as we suggest in a function on the configuration of their people. If you want a direct edition tool, Paint.net is the next level. The reduced elements and better scan and edit installed software, your system and, hopefully, your workflow, it is a bit more clean and Efgil. Yes He made his own purge of printer and have more advice, we will gladly listen to them in comments.
